Question 1.1. The power set of a finite set A is the set $\mathcal{P}(A)$ of all subsets of A . Determine a formula for $\#\mathcal{P}(A)$ in terms of $\#A$. Prove your formula is correct.

Proof. If the power set of $\mathcal{P}(A)$ contains the totality of all elements in A ie $a \in A$ and $A \in \mathcal{P}(A)$, then there also exists a relation between the cardinality of P and the cardinality of A . We can show this by example $A = \{1, 2\}$ therefore $P(A) = [\{0\}, \{1\}] \cup P(2) = [\{2\}]$. So the cardinality of $P(1)$ equals the cardinality of A , therefore we can show the cardinality of A added to the cardinality of $P(1)$ equals the cardinality of $P(A)$. \square

Question 1.2. Let $f : X \rightarrow Y$ be a function, and let $A, B \subset X$.

(i) Prove $f(A \cup B) = f(A) \cup f(B)$.

We first need to show $f(A \cup B) \subset f(A) \cup f(B)$ Let's say $y \in f(A \cup B)$, and there is $x \in f(A)$ or $x \in B$ so $f(x) \in f(B)$ in either case $y = f(x) \in f(A) \cup f(B)$ secondly we need to show $f(A) \cup f(B) \subset f(A \cup B)$ $y \in f(A) \cup f(B)$, so $y \in f(A)$ or $y \in f(B)$ if $y \in f(A)$, then there is $a \in A$ so $f(a) = y$ such that $y = f(a) \in f(A \cup B)$ since $a \in f(A \cup B)$ also if $y = f(B)$, then $y \in f(A \cup B)$ and the equality is complete.

(ii) Prove $f(A \cap B) \subset f(A) \cap f(B)$. Say $y \in f(A \cap B)$ and $x \in A \cap B$ so I can then say that $x \in A$, $y \in f(A)$ and $x \in B$ and $y \in f(B)$. So $y \in f(A) \cap f(B)$.

(iii) Find a counterexample to $f(A \cap B) = f(A) \cap f(B)$.

Proof. Let's say $A = \{1, 2\}$ and $B = \{1, 3\}$. Now we multiply A , which yields $A * A = \{1, 2, 2, 4\}$ and $B * A = \{1, 3, 3, 9\}$. Now, $f(A \cap B) = \{1, 2\}$ but $f(A) \cap f(B) = \{1, 0\}$. \square

Question 1.3. Define the relation \sim on \mathbb{Q} by $r \sim s$ if and only if $r - s \in \mathbb{Z}$. Prove \sim is an equivalence relation.

Proof. We know that $\mathbb{Z} \subset \mathbb{Q}$ and if $c \in r - s$ then $c \in \mathbb{Q}$ and $c \in \mathbb{Z}$ so $r \sim s$, $r \sim c$, and $s \sim c$ so it is transitive. also, $r - r \in \mathbb{Z}, \mathbb{Q}$ and $s - s \in \mathbb{Z}, \mathbb{Q}$ so it is reflexive. Finally since $r - s \in \mathbb{Z}$ then $s - r \in \mathbb{Z}$ because $r \sim s$ so it is symmetric. \square

Question 1.4. Let $f : X \rightarrow Y$ be a function. Prove that the relation $u \sim v$ if and only if $f(u) = f(v)$ is an equivalence relation.

Proof. Say $u \in x$ and $v \in y$ if $f(u) = f(v)$ and $v \in f(v)$ and $u \in f(u)$ then $f(v) \sim f(u)$ and this show reflexive as well as symmetric. If $c \in y$ then $c \in f(v), f(u)$ thus $c \sim u, c \sim v$, and of course $u \sim v$ which is transitive. \square
